WHEN THE SUN DISRUPTS EARTH

When the Sun disrupts Earth.

An evidence-first observatory for geomagnetic storms: real observations, explicit uncertainty, and no zero-fill.

NOAA / GFZ / NASA · 58 TESTS · PYTHON · STREAMLIT

Genuine offline sample · May 2024 · not live

github.com/Shahbaz2104/space-weather-observatory

Three ways a chart can lie.

None of them require bad data. They only require a misleading default.

01 **A gap drawn as quiet**

Missing observations become a flat line.

02 **An interpolated curve drawn as measurement**

Smoothing invents values that were never observed.

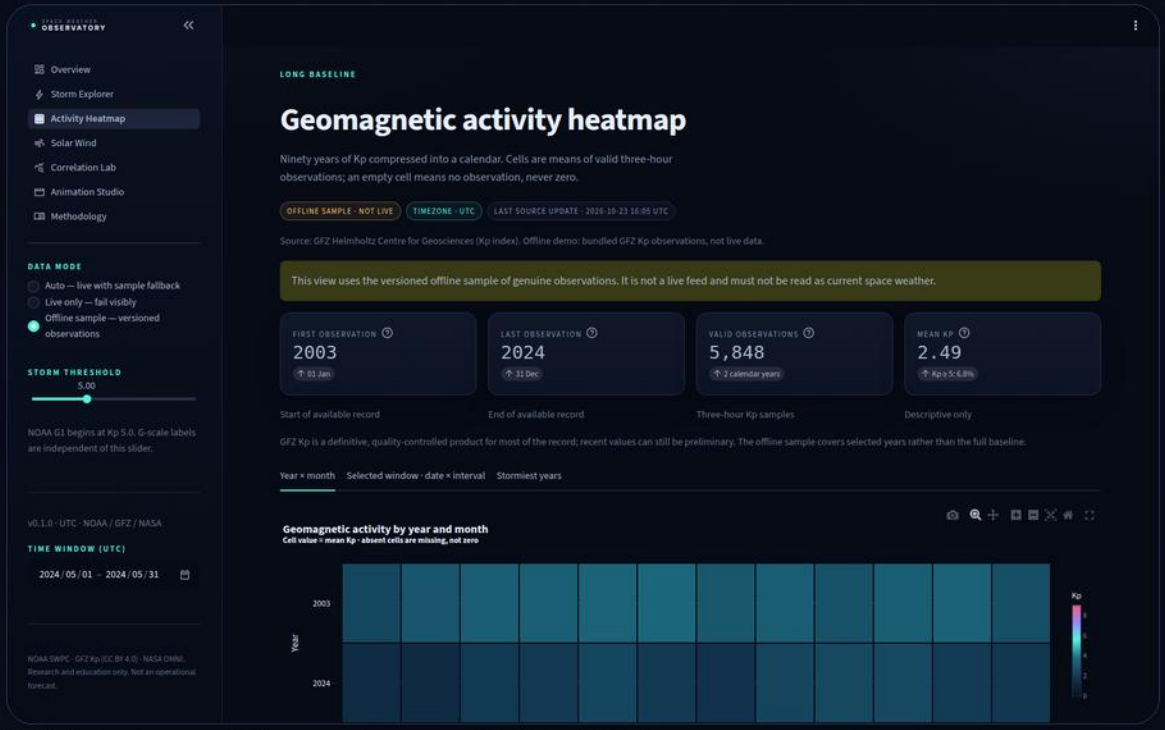

03 **A Kp value confused with a storm**

An activity index is not an event catalogue.

Seven linked views. One time convention.

From a live Kp overview to a ninety-year heatmap, every screen uses UTC and keeps missing observations missing.

Overview · Storm Explorer · Activity Heatmap · Solar Wind · Correlation Lab · Animation Studio · Methodology

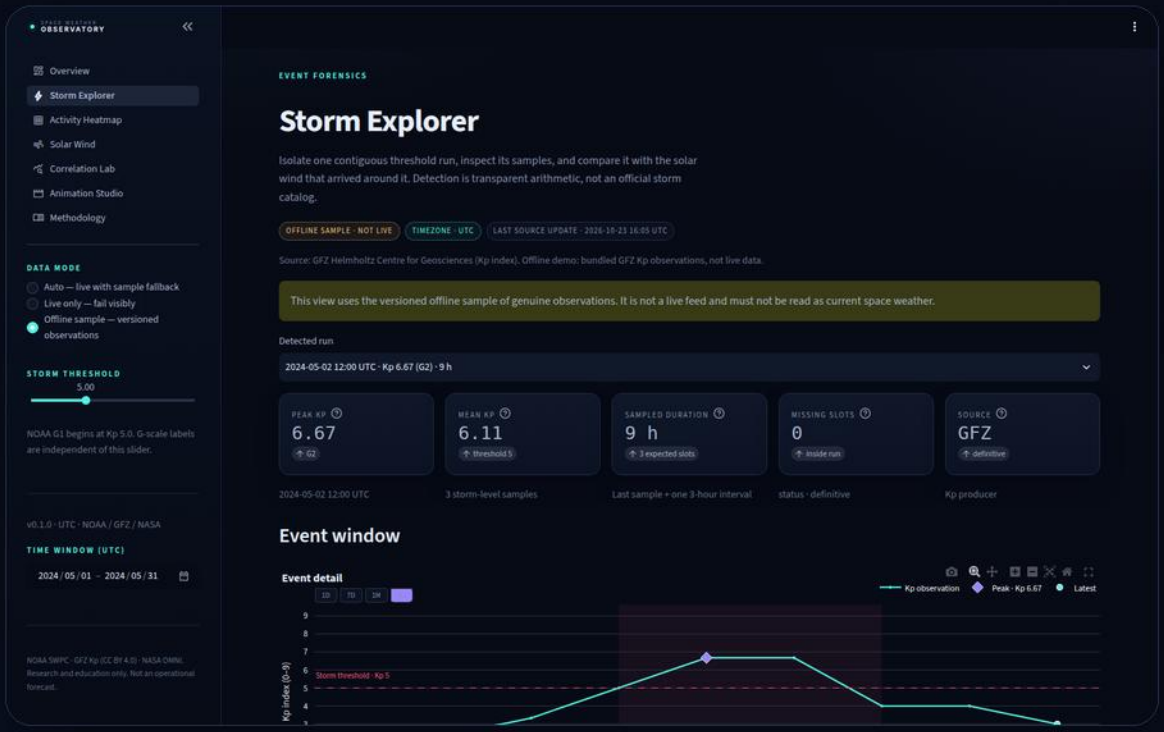

Activity heatmap · offline sample covers 2003 and 2024

github.com/Shahbaz2104/space-weather-observatory

Missing stays missing.

No interpolation. No zero-fill. No silent gap closure.

Display sampling keeps endpoints and missing-run boundaries, so a long series cannot be made to look continuous.

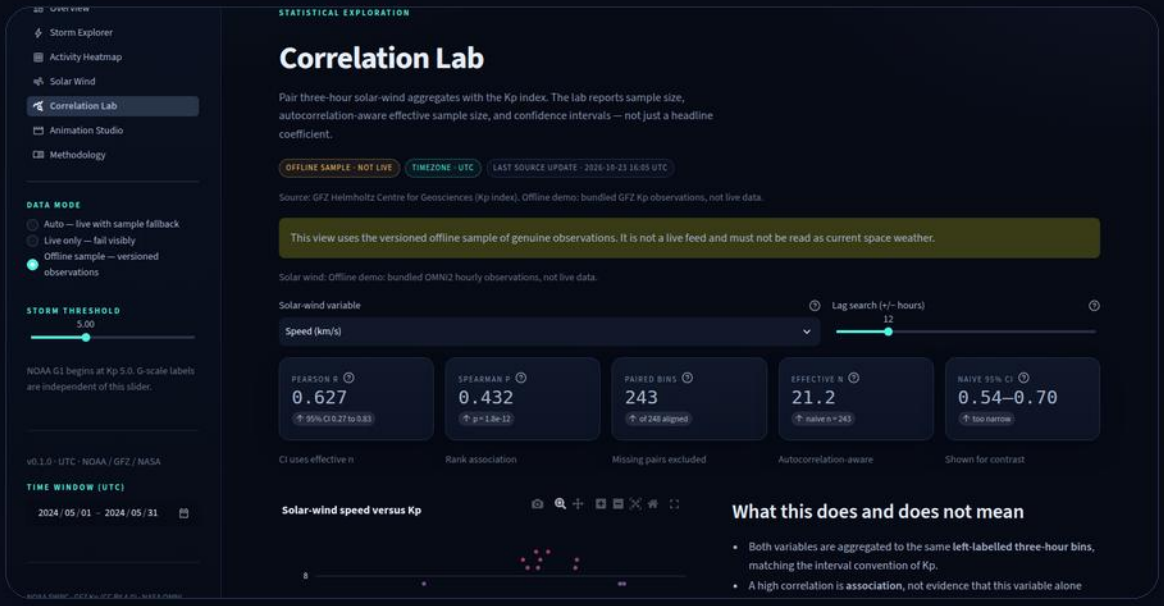

Storm Explorer · sampled span, missing slots, and provenance

JSON provenance is available for exports: sources, timestamps, units, transformations, threshold, and warnings.

A correlation is not a mechanism.

The lab reports the sample size and autocorrelation-aware uncertainty, not just the headline coefficient.

PEARSON r	EFFECTIVE n	PAIRED BINS
0.627	21.2	243
95% CI uses effective n	autocorrelation-aware	missing pairs excluded

May 2024 offline sample · solar-wind speed versus Kp

INSPECT THE EVIDENCE

Seven pages. Real observations.

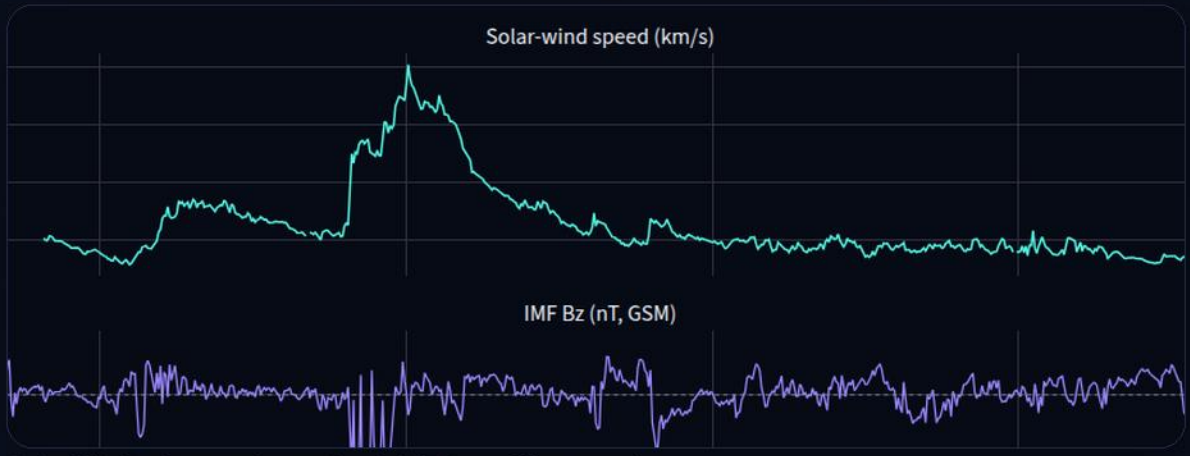

Python, Streamlit, Plotly, pandas, NumPy, SciPy, Matplotlib. Built to make the caveats as legible as the numbers.
